

SYCLIQ GEOSPATIAL PVT LTD
TPRI
Bangalore, India.

Dear All,

Trust this email finds you all in good health. We are capturing human geographic experience of food, weather, work and natural medicine based on geography for our SYCLIQ Project. We are collecting descriptive insights from all over the world, about geographic experience of food, weather, work and natural medicine based on the geography they are living in and how it could help us present preferences based on geography and migratory patterns and influence of geographic experience on a national/provincial/global scenario.

This could help us in providing insights about potential alternative insights and help us connect with similar geographic experience of food, weather and natural medicine elsewhere. It can help us correlate choices and approaches to visualize how we interact with geographic spaces based on food, weather, work and natural medicine.

This would be helpful in creating a collaborative platform to share geographic experience and replicate best practices based on weather, geography, food and natural medicine.

We are seeking volunteers to contribute to provide their native geographic experiences and also share their geographic experience based on migration for work/study or touristic adventure.

This would help us creating

- local food footprints and map native crops produce
- local medicinal plants and their usage in the industry.
- Map migratory patterns and user preference based on geographic experience.
- Map alternative geographic experience and choices
- map geographic exports of natural resources or raw materials based on their demand elsewhere.
- Map global supply chains for food and medicine.

These descriptive insights of geographic experience have an influence on shaping the culture and demand for products. An open platform, where a computational engine can help you draw deductive alternative insights would help us make informed decisions.

SYCLIQ GEOSPATIAL PVT LTD
TPRI
Bangalore, India.

We do NOT share any of your personal information, about ethnicity, race, gender or age. We are interested in how descriptive expressions are made about food, weather, work and medicine at a specific geographic location.

We welcome any suggestions to improve veracity of the geographic experience. We are interested to learn about the geographic experience worldwide. We shall be happy if you could share this among your network of friends and relatives to participate in the study.

Many thanks for your support.

Awase Khirni SYED Ph.D
